

# Benefits to Growing Native Plants

Native plants naturally occur in an ecosystem and contribute to the overall balance of the habitat.

Unfortunately, many landscaping plants available are non-native species which in turn alter the environment. Growing native species can counteract this and provide additional benefits as well:

01. Do not require fertilizers/pesticides.
02. Can reduce erosion and need less water.
03. Provides food and shelter to wildlife.
04. More resistant to local weather & extremes.
05. Promotes natural beauty & aesthetic appeal.

The featured species in LQ's Seed Library are Sunflowers, Monticello Perviana, Black-Eyed Susans, Grayhead Prairie Coneflower, Slender False Foxglove, Indian Grass, River Oats, Wild Bergamot, and Flower Mix.
